

## University of Vigo - LUME-1 satellite

*Telemetry modulation, codes and format*

### Physical layer

TTC frequency	437,060 MHz
S/C EIRP	30 dBm
S/C antenna	Turnstile
S/C polarization	RHCP / LHCP

### Data link layer

Modulation	GFSK
Bitrate	4800 / 9600 bps
Sync word	0x930B51DE
Frame format	ASM+Golay (AX100 mode 5)
Bit encoding	NRZ, most significant bit first
Scrambling	CCSDS randomization
Channel coding	Reed-Solomon (255, 223)

A demodulator and decoder based on GNU Radio is available:

<https://github.com/mndza/gr-sattools>

## Network layer - CSP

All the packets transmitted by the satellite use the CSP (Cubesat Space Protocol) protocol (<https://github.com/libcsp/libcsp>).

Priority	Source	Destination	Destination Port	Source Port	Reserved	HMAC	XTEA	RDP	CRC	Data
2 bits	5 bits	5 bits	6 bits	6 bits	4 bits	1 bit	1 bit	1 bit	1 bit	Variable
0x02	0x01	0x0F	0x0E	Variable	Variable	0x00	0x00	0x00	0x00	Variable

## Transport layer - TM transfer frames

Inside the CSP data field, TM transfer frames are used to encapsulate upper layer data. The TM transfer frames are an adaptation of CCSDS TM transfer standards.

The following table contains the definition of TM transfer frames used for the transmission of beacons (non-reliable channel):

Version number	S/C ID	Virtual channel ID	Virtual channel frame counter	First header pointer	Empty frame	OCF presence	Sequence flags	Fixed length frame	Data	Packet Errors	Frame Errors	Frame Error Control
2 bits	10 bits	4 bits	8 bits	11 bits	1 bit	1 bit	2 bits	1 bit	Var.	16 bits	16 bits	16 bits
0x00	0x41	0x01	Variable	0x00	0x00	0x01	0x03	0x00	Var.	Variable	Var.	Var.

When the satellite is in communication with the ground station a reliable channel is established between the station and the satellite using CSP RDP protocol. The TM transfer frames field values change to reflect this situation:

Version number	S/C ID	Virtual channel ID	Virtual channel frame counter	First header pointer	Empty frame	OCF presence	Sequence flags	Fixed length frame	Data	Packet Errors	Frame Errors	Frame Error Control
2 bits	10 bits	4 bits	8 bits	11 bits	1 bit	1 bit	2 bits	1 bit	Var.	16 bits	16 bits	16 bits
0x00	0x41	0x02	Variable	Variable	Var.	0x01	Var.	0x01	Var.	Variable	Var.	Var.

## Application layer - CCSDS Space Packets + ECSS Packet Utilization Standard (PUS)

TM transfer frames transport standard CCSDS SpacePackets implementing ECSS PUS services. A detailed description of PUS packets can be found in “ECSS, Telemetry and telecommand packet utilization. ECSS-E-ST-70-41C. 15 April 2016”.

Packet Version	Packet Type	Secondary Header Flag	Application Process Id	Sequence Flags	Packet Name	Packet Data Length	Secondary Header	User Data	PEC
3 bits	1 bit	1 bit	11 bits	2 bits	14 bits	16 bits	Variable	Variable	16 bits
0x00	0x00	0x01	0x01	0x03	Variable	Variable	Sub-struct. A	Sub-struct. B	Var.

For clarity, a description of housekeeping report packets (TM[3,25]) is included below in order to make easier the decoding of dashboard beacons from the satellite:

PUS Version	Time Reference	Service Type	Message Subtype	Type Counter	Destination Id	Day	Milliseconds of the day
4 bits	4 bits	8 bits	8 bits	16 bits	16 bits	16 bits	32 bits
0x01	Variable	0x03	0x19	Variable	0x03e8	Variable	Variable

ID	Parameters
16 bits	Variable
Variable	Variable

## Dashboard telemetry beacons

The satellite transmits a burst of 5 packets every 30 seconds. Each packet contains a TM frame with a single SpacePacket inside. Standard PUS service 3 (Housekeeping) is used to format these SpacePackets

Five different beacons are transmitted, each one with a different ID:

- **ID=1 - B1-OBC:** Telemetry from the main on-board computer.
- **ID=2 - B2-EPS:** Telemetry from the power subsystem.
- **ID=3 - B3-TTC+GSSB:** Telemetry from the TTC and the antenna deployment system.
- **ID=4 - B4-ADCS:** telemetry from the ADCS subsystem.
- **ID=5 - B5-Temps:** temperatures of different subsystems of the satellite platform.

All the parameter values are calibrated, no calibration equations are needed.

## Other telemetry packets

Apart from the beacons described in previous sections, the satellite can generate other telemetry packets. A detailed description of PUS packets can be found in “ECSS, Telemetry and telecommand packet utilization. ECSS-E-ST-70-41C. 15 April 2016”. Telemetry packets out of the PUS standard will be described in following sections.

In the table below you can find:

- **Packet ID:** composed by the service ID and the packet subtype ID as defined in the PUS standard (TM[<service>, <subtype>]).
- **Packet description:** a brief description of the packet meaning and contents.
- **Generation:** when this packet is generated on -board:
  - Periodic: the packet is generated autonomously with a certain period.
  - Event: the packet is generated autonomously when an event occurs
  - TC execution: the packet is generated only under specific telecommand from GS

Packet ID	Packet description	Generation
TM[1,1]	successful acceptance verification report	TC execution
TM[1,2]	failed acceptance verification report	TC execution
